FROM: Frank J. Filas, Reclamation Engineer 

RE: Site Inspection, M/015/030, Sinbad Mine

On April 16, 1987, Frank Filas visited this underground uranium mine and met with Bill Roedell. Bill's sons, Mike and Billy, are currently subleasing this property and actively mining uranium. Bill Wilson, the claim holder, has the permit and reclamation bond on the site.

The mine site consists of a decline, a one- to two-acre waste dump, a low-grade ore stockpile, a metal shed, a seven-mile access road, and a ventilation hole. Currently all waste is being gobbed underground and the site appears to be clean and well kept. The numerous drill holes to the west of the mine all appeared to be adequately plugged.

Roedell Mining had backfilled approximately 10-15 yards of mine waste into a portion of the access road. The backfilled area was checked with a microroetgen meter and a sample was taken. The radiation level was not very high, but the operator was advised to discontinue the practice.
